

AI internship (data + model + evaluation)

Quick Info

- Candidate: [Your Name]
- Host Organization: [Company / Lab]
- Duration: 8–12 weeks
- Focus: Applied ML / NLP / Computer Vision (choose one)

1. Internship Goal

Deliver an end-to-end AI proof of concept: dataset preparation, model training, evaluation, and a small demo showing the business/academic value.

2. Proposed Topic Options

Option A (NLP): document classification + information extraction.

Option B (CV): defect detection / object recognition with lightweight deployment.

Option C (Tabular ML): prediction + explainability for decision support.

3. Technical Plan

- Data ingestion and cleaning; define labels and leakage checks.
- Baseline model (classical ML) then improved model (transformer/CNN/GBM).
- Evaluation protocol: train/validation split, metrics, error analysis.
- Packaging: notebook + simple API or demo UI.

4. Deliverables

- Clean dataset pipeline + documentation.
- Trained model(s) + reproducible training code.
- Report: results, limitations, next steps.
- Demo (script/API) showing inference on new samples.

5. Risks & Mitigation

Risk: insufficient data quality/quantity. Mitigation: data augmentation, weak supervision, or simplifying the target. Risk: overfitting. Mitigation: cross-validation, regularization, and robust evaluation.
